**SIGINT Development Challenge:** Identify access methods into segregated networks involved in [REDACTED]

**Mission Example and Result:** Discovered detailed plans for [REDACTED] classified Voice-Over-IP network, resulting in intelligence acted on by a joint NSA-IC partner team in an overseas location to perform supply-chain interdiction on the shipment. Information briefed to senior staff for IC partners, NSA and third party partners.

### Our Approach

- Identified order from [REDACTED] to [REDACTED] and tracked to [REDACTED], then into China, as the source vendor.
- Extensive analysis through Cloud ABR and XKEYSCORE enabled identification of multiple selectors for targeting.
- Coordinated with TAO to enable CNE access against key support personnel.
- Drafted inputs for urgent cables sent to overseas stations and foreign partners in order to coordinate ground operations.
- Shifted schedule to collaborate in near-real-time with overseas stations. Provided IC Partner with documentation from end-point accesses, critical to duplicate original shipment packing.

**SIGINT Development Outcome:** The analysis and reporting on this target identified, with high granularity, [REDACTED]'s method of hardware procurement. As a result of these efforts, NSA and its IC partners are now positioned for success with future opportunities
